COVER LETTER

Finding your passion in life is not easy for most people, it takes time and dedication to really figure out the career that you truly enjoy.

After all my years of middle and high school it only took me taking my first engineering class to find my passion in life: computer science.

I am currently pursuing a bachelors degree in computer science at Amrita School of Engineering.

While I am obtaining my degree I started exploring different domains of computer science along with my academics. I learnt web development, mobile development, different frame works, some quite famous and useful programming like C/C++, Java, JavaScript, Python etc. After the end of first year and 3rd semester was about to begin, i enroll myself for a 3 months long internship as a software developer fellow role at DeepThought EduTech Ventures, an early stage and fast growing product based indian startup.

I joined this internship because i wanted to get industry leve lexperience as sooner as i can because experience along with knowledge is very important. I wanted myself to know whatever i am learning, how these are used to make products for the betterment of society. I am Product management enthuasist so, to reach at the level of my dream, i need a lot of experiences. And there is no better options than starting learning from the begining.

I learnt a lot of coding and non-coding skills from my first internship. Since, it was a startup, i was able to get discuss with the non-coding teams time to time. So, i learnt how to communicate with them. I learnt to get adjust in a team, how can i contribute in my team to make it more worth in our product. I also learnt some principles of Leadership.

I also contribute in different teams with my coding skills, got chances to learn different new technical skills. I got familiar with react native only from the internship. I got idea and patience required to go through the large scale projects code bases. Since, for a begineer and unexperienced people they are unknown about these things. I fixes many frontend bugs, also worked on many features. Did many brainstorming sessions with my teammates on different projects/features, learnt to document them.

Currently, i'm working on my DSA and Problem Solving Skills and also working on some projects using the skills i have till the date. I am constantly looking on ways to improve my coding skills and I am actively looking for internships that could help me to nurture my passion via immersion in the enterprise world. Also learning how people interact with each other to deliver business value to their customers with the software solutions they design, code and test.

I see myself with in a year at tech company working on a huge impact projects in our society and learning project management being in the group of some experts in this field.
